Quiz — Passkeys / WebAuthn

Fillable quiz — type answers in the fields. Blank copies are already under `my-work/quizzes/`; answer them in place. Answer keys are not included.

1. Why can TOTP still be phished when the code is “something you have”?

2. How does WebAuthn / a passkey bind a credential so a lookalike domain fails — what is the RP ID doing?

3. Why must enterprises plan recovery when a device is lost before turning off OTP — what fails if reset is “email link alone”?

4. Why does finishing Challenge Gym TOTP *not* mean you implemented WebAuthn — what gap remains on the job?

5. Scenario: A helpdesk resets MFA by email link alone with no secondary check. What goes wrong?

6. Spot the bug: WebAuthn RP ID is set to a parent domain the site does not control. Risk?
