Quiz — DMARC policy helper

Fillable quiz — type answers in the fields. Blank copies are already under `my-work/quizzes/`; answer them in place. Answer keys are not included.

Complete after the `dmarc_policy` assignment and kata. Check the separate answer key only after you attempt every item.

1. Why does a DMARC record need `v=DMARC1` first — what fails for receivers if the version tag is missing or not first?

2. How do `p=` and `sp=` differ, and when would you set them differently?

3. Why collect `rua=` aggregate reports before moving to `p=reject`?

4. Scenario: Your kata's parser accepts a legacy `pct=50` tag. RFC 9989 (current DMARC) removed `pct`. What did `pct` change operationally under the old RFC 7489 model, and why does a helper still need to surface legacy `pct` when present?

5. Spot the bug: A policy string is `p=reject; v=DMARC1; rua=mailto:dmarc@example.com`. What goes wrong and **why**?

6. Why is outbound hold/DLP complementary to DMARC rather than a substitute for `p=` enforcement?
