Quiz — Mail flow + DMARC analytics

Fillable quiz — type answers in the fields. Blank copies are already under `my-work/quizzes/`; answer them in place. Answer keys are not included.

1. Why does MX placement control inbound delivery entry, and how does an outbound smart-host change SPF outcomes for the same org?

2. Scenario: SPF fail, DKIM pass aligned — can DMARC pass? Why does that matter after a gateway relay?

3. Spot-the-bug: gateway strips DKIM-Signature when rewriting bodies but keeps SPF pass assumptions. What fails downstream and why?

4. Why climb the policy ladder (`none` → `quarantine` → `reject`) using aggregate reports instead of jumping to reject?

5. Why does ARC exist — what authentication problem do intermediaries create that ARC aims to carry forward?

6. Why keep an aiosmtpd lab offline / local-only?
