Quiz — Hold state

Fillable quiz — type answers in the fields. Blank copies are already under `my-work/quizzes/`; answer them in place. Answer keys are not included.

1. How: Draw (or list) legal transitions among held / approved / released / rejected. Which single jump is illegal and **why**?

2. Why: Why must **release** require a prior **approve** instead of releasing straight from held?

3. Scenario: An operator clicks release on a still-held item. What should the API return (**409** vs **412** vs Idempotency-Key replay), and what goes wrong if it silently no-ops with 200?

4. Spot the bug: `if action == "release": state = "released"` with no prior-state check. Abuse story?

5. Why: Why keep auto-bcc as an explicit action kind rather than a silent side effect of allow?

6. How / why: Which tool manages schema migrations for SQLAlchemy apps, and why not hand-edit production tables?

7. Literacy: When would you return **412 Precondition Failed** instead of **409**, and how does an **Idempotency-Key** on Release differ from both?

8. Why / how: Two operators race to approve the same held message. Why must the server use `UPDATE … WHERE state='held'` and require `rowcount == 1` for the winner — what goes wrong with plain read-then-write?
