Quiz — MailGuard Admin

Fillable quiz — type answers in the fields. Blank copies are already under `my-work/quizzes/`; answer them in place. Answer keys are not included.

Complete after the module reading. Check the separate answer key only after you attempt every item.

1. Why: Why is TypeScript `strict` useful for rule forms (vs catching everything only at runtime in the browser)?

2. Why / how (RFC 10017): Where should long-lived API tokens *not* live, what **BFF** pattern replaces them for a SPA calling a rules API, and why CSRF defenses still matter with cookie sessions?

3. Scenario: An operator releases a held message from the admin. Which audit fields would you log, and **why** is “previous state → new state” more useful than only “released”?

4. Spot the bug / why: `innerHTML = message.subject` in the hold queue. What is the risk, and what safer approach should you use?

5. How / a11y (WCAG 2.2): Name focus/keyboard requirements for an Approve confirm dialog (`role="dialog"`, Escape, focus return) and **why** icon-only buttons fail operators using assistive tech.

6. Trade-off: Why might you confirm “Release” with a second step even though it slows the happy path?

7. Scenario / XSS: The hold queue shows subject `<img src=x onerror="alert(1)">`. What binding must the UI use, and how does CI's `vue-tsc` / render test help catch regressions?
