Quiz — CI + AWS

Fillable quiz — type answers in the fields. Blank copies are already under `my-work/quizzes/`; answer them in place. Answer keys are not included.

Complete after the module reading. Check the separate answer key only after you attempt every item.

1. Why does CI on every PR matter for a hold/allow rules engine more than “we’ll test before the big demo”?

2. Expand **CI** and **OIDC** (in the deploy sense), then explain **how** OIDC deploy differs from storing long-lived AWS keys.

3. Name one least-privilege choice for a deploy role and **why** it shrinks blast radius.

4. How should a PR workflow for MailGuard’s Python core be ordered (setup → …), and **why** run tests before any deploy/image-push job?

5. Scenario: A workflow prints `echo $AWS_SECRET_ACCESS_KEY` for debugging. What fails, and **why** is log redaction alone not enough?

6. Spot the bug / why: `permissions: write-all` on a public fork PR workflow. What can go wrong and how would you tighten it?
