Quiz — OIDC → AWS

Fillable quiz — type answers in the fields. Blank copies are already under `my-work/quizzes/`; answer them in place. Answer keys are not included.

1. How does GitHub Actions obtain AWS credentials without storing access keys, and which action/family is commonly used?

2. Scenario: JWT `sub` is `repo:acme/app:ref:refs/heads/feat` but the IAM trust allows only `refs/heads/main`. Should `AssumeRoleWithWebIdentity` succeed? **Why?**

3. Spot the bug / why: A workflow still exports `AWS_SECRET_ACCESS_KEY` from repository secrets "just in case" beside OIDC.

4. Why does Fargate shrink ops surface vs EC2-backed ECS for a small API task?

5. Name the GitHub OIDC issuer host used with AWS, and **why** AWS must trust that issuer specifically.

6. Why prefer lowercase service names in naming helpers (DNS/API), not just style preference?
