Quiz — Cloud IAM posture

Fillable quiz — type answers in the fields. Blank copies are already under `my-work/quizzes/`; answer them in place. Answer keys are not included.

1. Expand **IAM**, then explain **how** a role, a policy, and a resource fit together for a MailGuard queue consumer.

2. Why is `Action: "*"` on a runtime role a smell (not just “style”)?

3. What is “shared responsibility” in one sentence, and **why** does object-storage exposure usually fall on the customer side?

4. Name one misconfig that could expose Secure Drop objects, and **how** you would detect it before production.

5. Scenario: Terraform state with cloud credentials is committed to a public repo. What do you do first, and **why** that order?

6. Spot the bug / why: A bucket policy uses `"Principal": "*"` with Block Public Access disabled. What is the risk mechanism?
