Quiz — Argo / Crossplane

Fillable quiz — type answers in the fields. Blank copies are already under `my-work/quizzes/`; answer them in place. Answer keys are not included.

1. Is Argo CD primarily pull or push GitOps? Explain **how** reconciliation runs.

2. Scenario: CI applies kubectl from a laptop token — pull or push? **Why** is that riskier for audit?

3. Spot the bug / why: policy allows privileged pods in a prod namespace. What can an attacker do after container escape?

4. What is a Crossplane claim in one sentence, and **why** might a team prefer claims over every engineer using the cloud console?

5. Why fail the pipeline on a bad manifest before sync rather than “let Argo roll it back later”?

6. Name one policy-as-code tool listed in the reading and **how** you would use it on a PR.
