Quiz — GitOps + policy

Fillable quiz — type answers in the fields. Blank copies are already under `my-work/quizzes/`; answer them in place. Answer keys are not included.

Complete after the module reading. Check the separate answer key only after you attempt every item.

1. What is the desired-state source of truth in GitOps, and **why** is that better than “whatever is live in the cluster”?

2. Pull vs push sync — one sentence each on **how** they differ mechanically.

3. Why fail CI on a bad manifest before sync (not only after a failed rollout)?

4. Name one policy-as-code tool family and **how** it stops a missing-probe Deployment.

5. Scenario: git says replicas=2 but the cluster still has 5 and nobody synced. Where is drift, and **how** do you repair the GitOps way?

6. Spot the bug / why: a policy allows `:latest` tags in production. What risk mechanism follows?

7. Why / how: Why verify image **attestations at admission** (not only sign in CI), and why pin `@sha256:…` digests in the Deployment?
