Quiz — OSS & security UX

Fillable quiz — type answers in the fields. Blank copies are already under `my-work/quizzes/`; answer them in place. Answer keys are not included.

1. Expand **OSS**. Name one step before opening a PR and **why** that step prevents wasted review.

2. Why is “just make the user click through a scary modal” weak security UX for hold/release?

3. What honesty rule applies to phishing *education* UIs in this course, and **how** do you enforce it in product copy?

4. Is this module required for Phase A Must rows on the capstone rubric? **Why** mark stretch vs must clearly?

5. Scenario: A security warning dismisses forever with one click and no confirmation. UX risk — **how** would you redesign?

6. Spot the bug / why: A PR description says “fixed stuff” with no test plan. What should change for security-sensitive UX?
