Quiz — SCIM

Fillable quiz — type answers in the fields. Blank copies are already under `my-work/quizzes/`; answer them in place. Answer keys are not included.

1. SCIM stands for? In one sentence, **how** does it move identity lifecycle into an app?

2. Scenario: employee left 36h ago, SLA=24h — which risk label does the kata return, and **why** is leave latency higher risk than slow joins?

3. Spot the bug / why: provisioning sets `active: false` but leaves sessions, API tokens, and auth caches intact. What access path remains?

4. Why is filter support required for many IdP provisioning clients?

5. Name one difference between JIT and SCIM, and **when** JIT alone is insufficient.

6. Why split SCIM into a core schema RFC and a separate protocol RFC — and which number is the **protocol** (HTTP operations)?

7. Name one **Entra vs Okta** PATCH interop difference (casing, `active` type, PUT vs PATCH, or group members) and **how** a server should normalize it.

8. Why / how: What does RFC 9865 add for SCIM list queries, and how does a client request the next page?
