Self-check — Recipient risk

Fillable quiz — type answers in the fields, then save a copy under `my-work/quizzes/` in the course repo. Answer keys are not included.

Complete after `../readings/recipient_risk.md`. Attempt before opening the answer key.

1. What three recipient classes does this kata care about relative to an org domain?

2. Why can a **mixed** internal+external recipient set be a missend signal?

3. Expand **BEC** and contrast it briefly with an accidental missend.

4. Why normalize (e.g. lowercase domain) before comparing addresses?

5. What address parsing gap does this kata deliberately accept?

6. Scenario: Org domain `mailguard.example`. Recipients `Alex@MailGuard.Example` and `vendor@other.example` — mixed or not? Why?
