Self-check — TOTP verify

Fillable quiz — type answers in the fields, then save a copy under `my-work/quizzes/` in the course repo. Answer keys are not included.

Complete after `../readings/totp_verify.md`. Attempt before opening the answer key.

1. Expand **TOTP** and state what inputs produce the short code.

2. How does TOTP relate to **HOTP**?

3. Why does `verify` often accept a small **window**? What problem does that *not* solve?

4. Name one reason a challenge-style task prefers a library (e.g. `pyotp`) over hand-rolling **HMAC**.

5. List two production MFA controls that belong later (e.g. in MailGuard MFA), not in this kata.

6. Scenario: A user's phone clock is 45 seconds ahead of the server. With a 30-second step and `valid_window=1`, might a just-generated code still verify? Briefly why.
